Edexcel

Mark Scheme (Results)

June 2019

Pearson Edexcel GCE
In Physics (9PH0)
Paper 02 Advanced Physics II

Edexcel and BTEC Qualifications

Edexcel and BTEC qualifications are awarded by Pearson, the UK's largest awarding body. We provide a wide range of qualifications including academic, vocational, occupational and specific programmes for employers. For further information visit our qualifications websites at www.edexcel.com or www.btec.co.uk. Alternatively, you can get in touch with us using the details on our contact us page at www.edexcel.com/contactus.

Pearson: helping people progress, everywhere

Pearson aspires to be the world's leading learning company. Our aim is to help everyone progress in their lives through education. We believe in every kind of learning, for all kinds of people, wherever they are in the world. We've been involved in education for over 150 years, and by working across 70 countries, in 100 languages, we have built an international reputation for our commitment to high standards and raising achievement through innovation in education. Find out more about how we can help you and your students at: www.pearson.com/uk

General Marking Guidance

- All candidates must receive the same treatment. Examiners must mark the first candidate in exactly the same way as they mark the last.
- Mark schemes should be applied positively. Candidates must be rewarded for what they have shown they can do rather than penalised for omissions.
- Examiners should mark according to the mark scheme not according to their perception of where the grade boundaries may lie.
- There is no ceiling on achievement. All marks on the mark scheme should be used appropriately.
- All the marks on the mark scheme are designed to be awarded. Examiners should always award full marks if deserved, i.e. if the answer matches the mark scheme. Examiners should also be prepared to award zero marks if the candidate's response is not worthy of credit according to the mark scheme.
- Where some judgement is required, mark schemes will provide the principles by which marks will be awarded and exemplification may be limited.
- When examiners are in doubt regarding the application of the mark scheme to a candidate's response, the team leader must be consulted.
- Crossed out work should be marked UNLESS the candidate has replaced it with an alternative response.

Quality of Written Communication

Questions which involve the writing of continuous prose will expect candidates to:

- write legibly, with accurate use of spelling, grammar and punctuation in order to make the meaning clear
- select and use a form and style of writing appropriate to purpose and to complex subject matter
- Organise information clearly and coherently, using specialist vocabulary when appropriate.

Full marks will be awarded if the candidate has demonstrated the above abilities. Questions where QWC is likely to be particularly important are indicated (QWC) in the mark scheme, but this does not preclude others.

Physics Specific Marking Guidance

Underlying principle

The mark scheme will clearly indicate the concept that is being rewarded, backed up by examples. It is not a set of model answers.

For example:

Horizontal force of hinge on table top

66.3 (N) or 66 (N) **and** correct indication of direction [no ue]

[Some examples of direction: acting from right (to left) / to the left / West / opposite direction to horizontal. May show direction by arrow. Do not accept a minus sign in front of number as direction.]

This has a clear statement of the principle for awarding the mark, supported by some examples illustrating acceptable boundaries.

Mark scheme format

- Bold lower case will be used for emphasis.
- Round brackets () indicate words that are not essential e.g. “(hence) distance is increased”.
- Square brackets [] indicate advice to examiners or examples e.g. [Do not accept gravity] [ecf].

Unit error penalties

- A separate mark is not usually given for a unit but a missing or incorrect unit will normally cause the final calculation mark to be lost.
- Incorrect use of case e.g. ‘Watt’ or ‘w’ will not be penalised.
- There will be no unit penalty applied in ‘show that’ questions or in any other question where the units to be used have been given.
- The same missing or incorrect unit will not be penalised more than once within one question but may be penalised again in another question.
- Occasionally, it may be decided not to penalise a missing or incorrect unit e.g. the candidate may be calculating the gradient of a graph, resulting in a unit that is not one that should be known and is complex.
- The mark scheme will indicate if no unit error penalty is to be applied by means of [no ue].

Significant figures

- Use of an inappropriate number of significant figures in the theory papers will normally only be penalised in ‘show that’ questions where use of too few significant figures has resulted in the candidate not demonstrating the validity of the given answer.
- Use of an inappropriate number of significant figures will normally be penalised in the practical examinations or coursework.
- Using $g = 10 \text{ m s}^{-2}$ **will** be penalised.

Calculations

- Bald (i.e. no working shown) correct answers score full marks unless in a ‘show that’ question.
- Rounding errors will not be penalised.
- If a ‘show that’ question is worth 2 marks then both marks will be available for a reverse working; if it is worth 3 marks then only 2 will be available.
- use of the formula means that the candidate demonstrates substitution of physically correct values, although there may be conversion errors e.g. power of 10 error.
- recall of the correct formula will be awarded when the formula is seen or implied by substitution.
 - The mark scheme will show a correctly worked answer for illustration only.

Question Number	Acceptable answer	Additional guidance	Mark
1	C	The only correct answer is C : main sequence – red giant – white dwarf A is not correct because it is white dwarf – red giant – main sequence B is not correct because it moves along the main sequence from large to small D is not correct because it moves along the main sequence from small to large	1
2	B	The only correct answer is B : for each spring, $\frac{1}{2}$ force, so $\frac{1}{2}$ extension, so $\frac{1}{2} Fx$ gives $\frac{1}{4} E$, so total is $\frac{1}{2} E$ A is not correct because it is the energy for one spring with this extension C is not correct because it only applies the factor of $\frac{1}{2}$ once D is not correct because it is the energy for two springs, each with the original extension	1
3	D	The only correct answer is D : the binding energy per nucleon curve shows an increase for both processes A is not correct because both processes show decreases B is not correct because fission shows a decrease C is not correct because fusion shows a decrease	1
4	C	The only correct answer is C : mass decrease by 20 \rightarrow 5 α , which is a charge decrease of 10, but total charge decrease is 6, so 4 β A is not correct because there are too few alpha and too many beta B is not correct because there are too few alpha and too many beta D is not correct because there are too many beta	1
5	B	The only correct answer is B : light leaving Y is polarised in its plane of polarisation and 135° is perpendicular to the plane of Y, so there will be maximum absorption by filter Z A is not correct because Z is not perpendicular to the plane of Y so some light is transmitted C is not correct because Z is not perpendicular to the plane of Y so some light is transmitted D is not correct because Z is not perpendicular to the plane of Y so some light is transmitted	1
6	D	The only correct answer is D : a wave of greater intensity would still transfer energy at a greater rate which could release photoelectrons at a greater rate even if they could absorb energy continuously A is not correct because time would be required for absorption of sufficient wave energy B is not correct because absorption of sufficient wave energy would occur over time C is not correct because at higher intensities the waves would have higher amplitudes and energy could increase over time to higher values	1

7	C	<p>The only correct answer is C: luminosity is proportional to temperature⁴ which means a 16-fold increase, and luminosity is proportional to area, which is proportional to diameter², and so means a 4-fold decrease, so there is a 4-fold increase overall</p> <p>A is not the correct answer because this only accounts for the decrease due to decreasing diameter</p> <p>B is not the correct answer because this is the answer obtained if the power applied to temperature is 2 instead of 4</p> <p>D is not the correct answer because the effect of area is not included</p>	1
8	B	<p>The only correct answer is B: Upthrust is density of fluid \times volume of object $\times g$</p> <p>A is not the correct answer because density of object has been used, so this is the gravitational force acting on the object</p> <p>C is not the correct answer because this is the resultant force</p> <p>D is not the correct answer because this is the mean of the magnitude of the forces in A and B</p>	1
9	D	<p>The only correct answer is D: potential is proportional to $1/x$</p> <p>A is not correct because electric fields do not cause a force on uncharged particles</p> <p>B is not correct because the force caused by gravitational field has only ever been shown to be attractive</p> <p>C is not correct because field strength is inversely proportional to x^2</p>	1
10	D	<p>The only correct answer is D: velocity is maximum when displacement is zero, and vice versa, and has positive and negative values since the direction reverses</p> <p>A is not correct because this shows maximum velocity when it should be minimum and vice versa</p> <p>B is not correct because this shows maximum velocity when it should be minimum and vice versa</p> <p>C is not correct because this does not show the change in direction of velocity during an oscillation</p>	1
